## Introduction

The purpose of this study is to investigate the effects of a new educational program on student learning outcomes. The program, which focuses on critical thinking and problem-solving skills, was implemented in a large university over a period of two years. The study aims to determine whether the program leads to significant improvements in students' performance on standardized tests and their ability to apply knowledge in real-world scenarios.

The research is structured as follows: the first section provides a detailed overview of the program's design and implementation. The second section describes the data collection methods and the statistical analysis used to evaluate the program's impact. The final section discusses the findings and their implications for educational practice.

The program was designed to address the need for students to develop higher-order thinking skills. It includes a series of modules that cover various aspects of critical thinking, such as identifying logical fallacies, evaluating evidence, and making reasoned judgments. The program is delivered through a combination of classroom instruction and self-paced online learning. The implementation was carried out by a team of experienced educators who received specialized training to ensure the program's fidelity.

Data was collected from a large sample of students who participated in the program. Pre-test and post-test scores were obtained from standardized assessments that measure critical thinking and problem-solving skills. The data was analyzed using a series of statistical tests to determine if there were significant differences between the scores of students who completed the program and those who did not. The results of the analysis are presented in the following sections.
